If an application were to freeze up and not respond, my first step would be to reopen the application, to see if it will work as intended. If that does not fix the problem, then the next thing I would do is uninstall the program and reinstall it, to see if that would make it respond appropriately. If that doesn't fix the problem, I would check if it needed to be updated. So, I would download an update to the application and check if that will fix the problem. If it isn't an update issue and the problem persists, then it might have something to do with the compatibility of my system. So, if that is the case, I would see if I can download a version that is more compatible with my current system. If the problem still exists after that, then it might have something to do with malware. If that is the case, then I will use antivirus software to try and erase any signs of potential viruses.
